

Palindrome partitioning

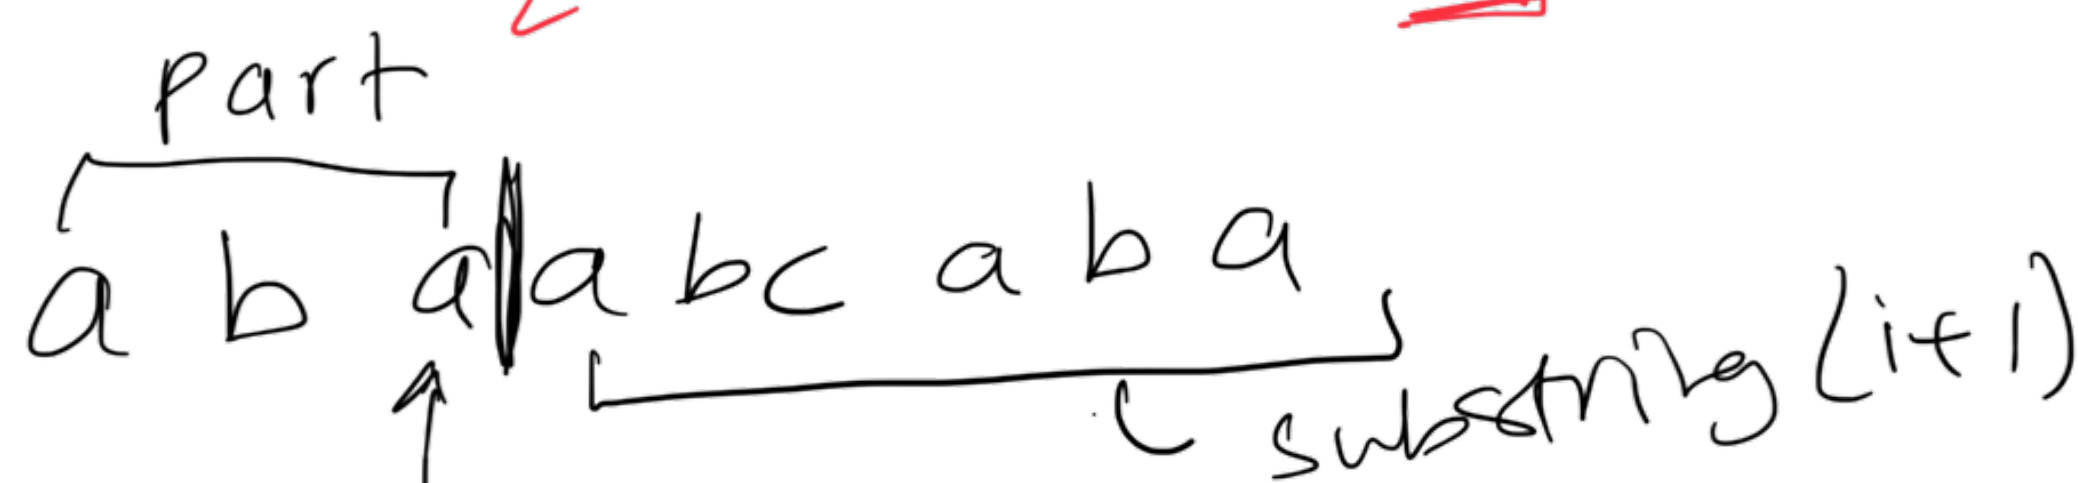

String s = "aab"

lets take one more example

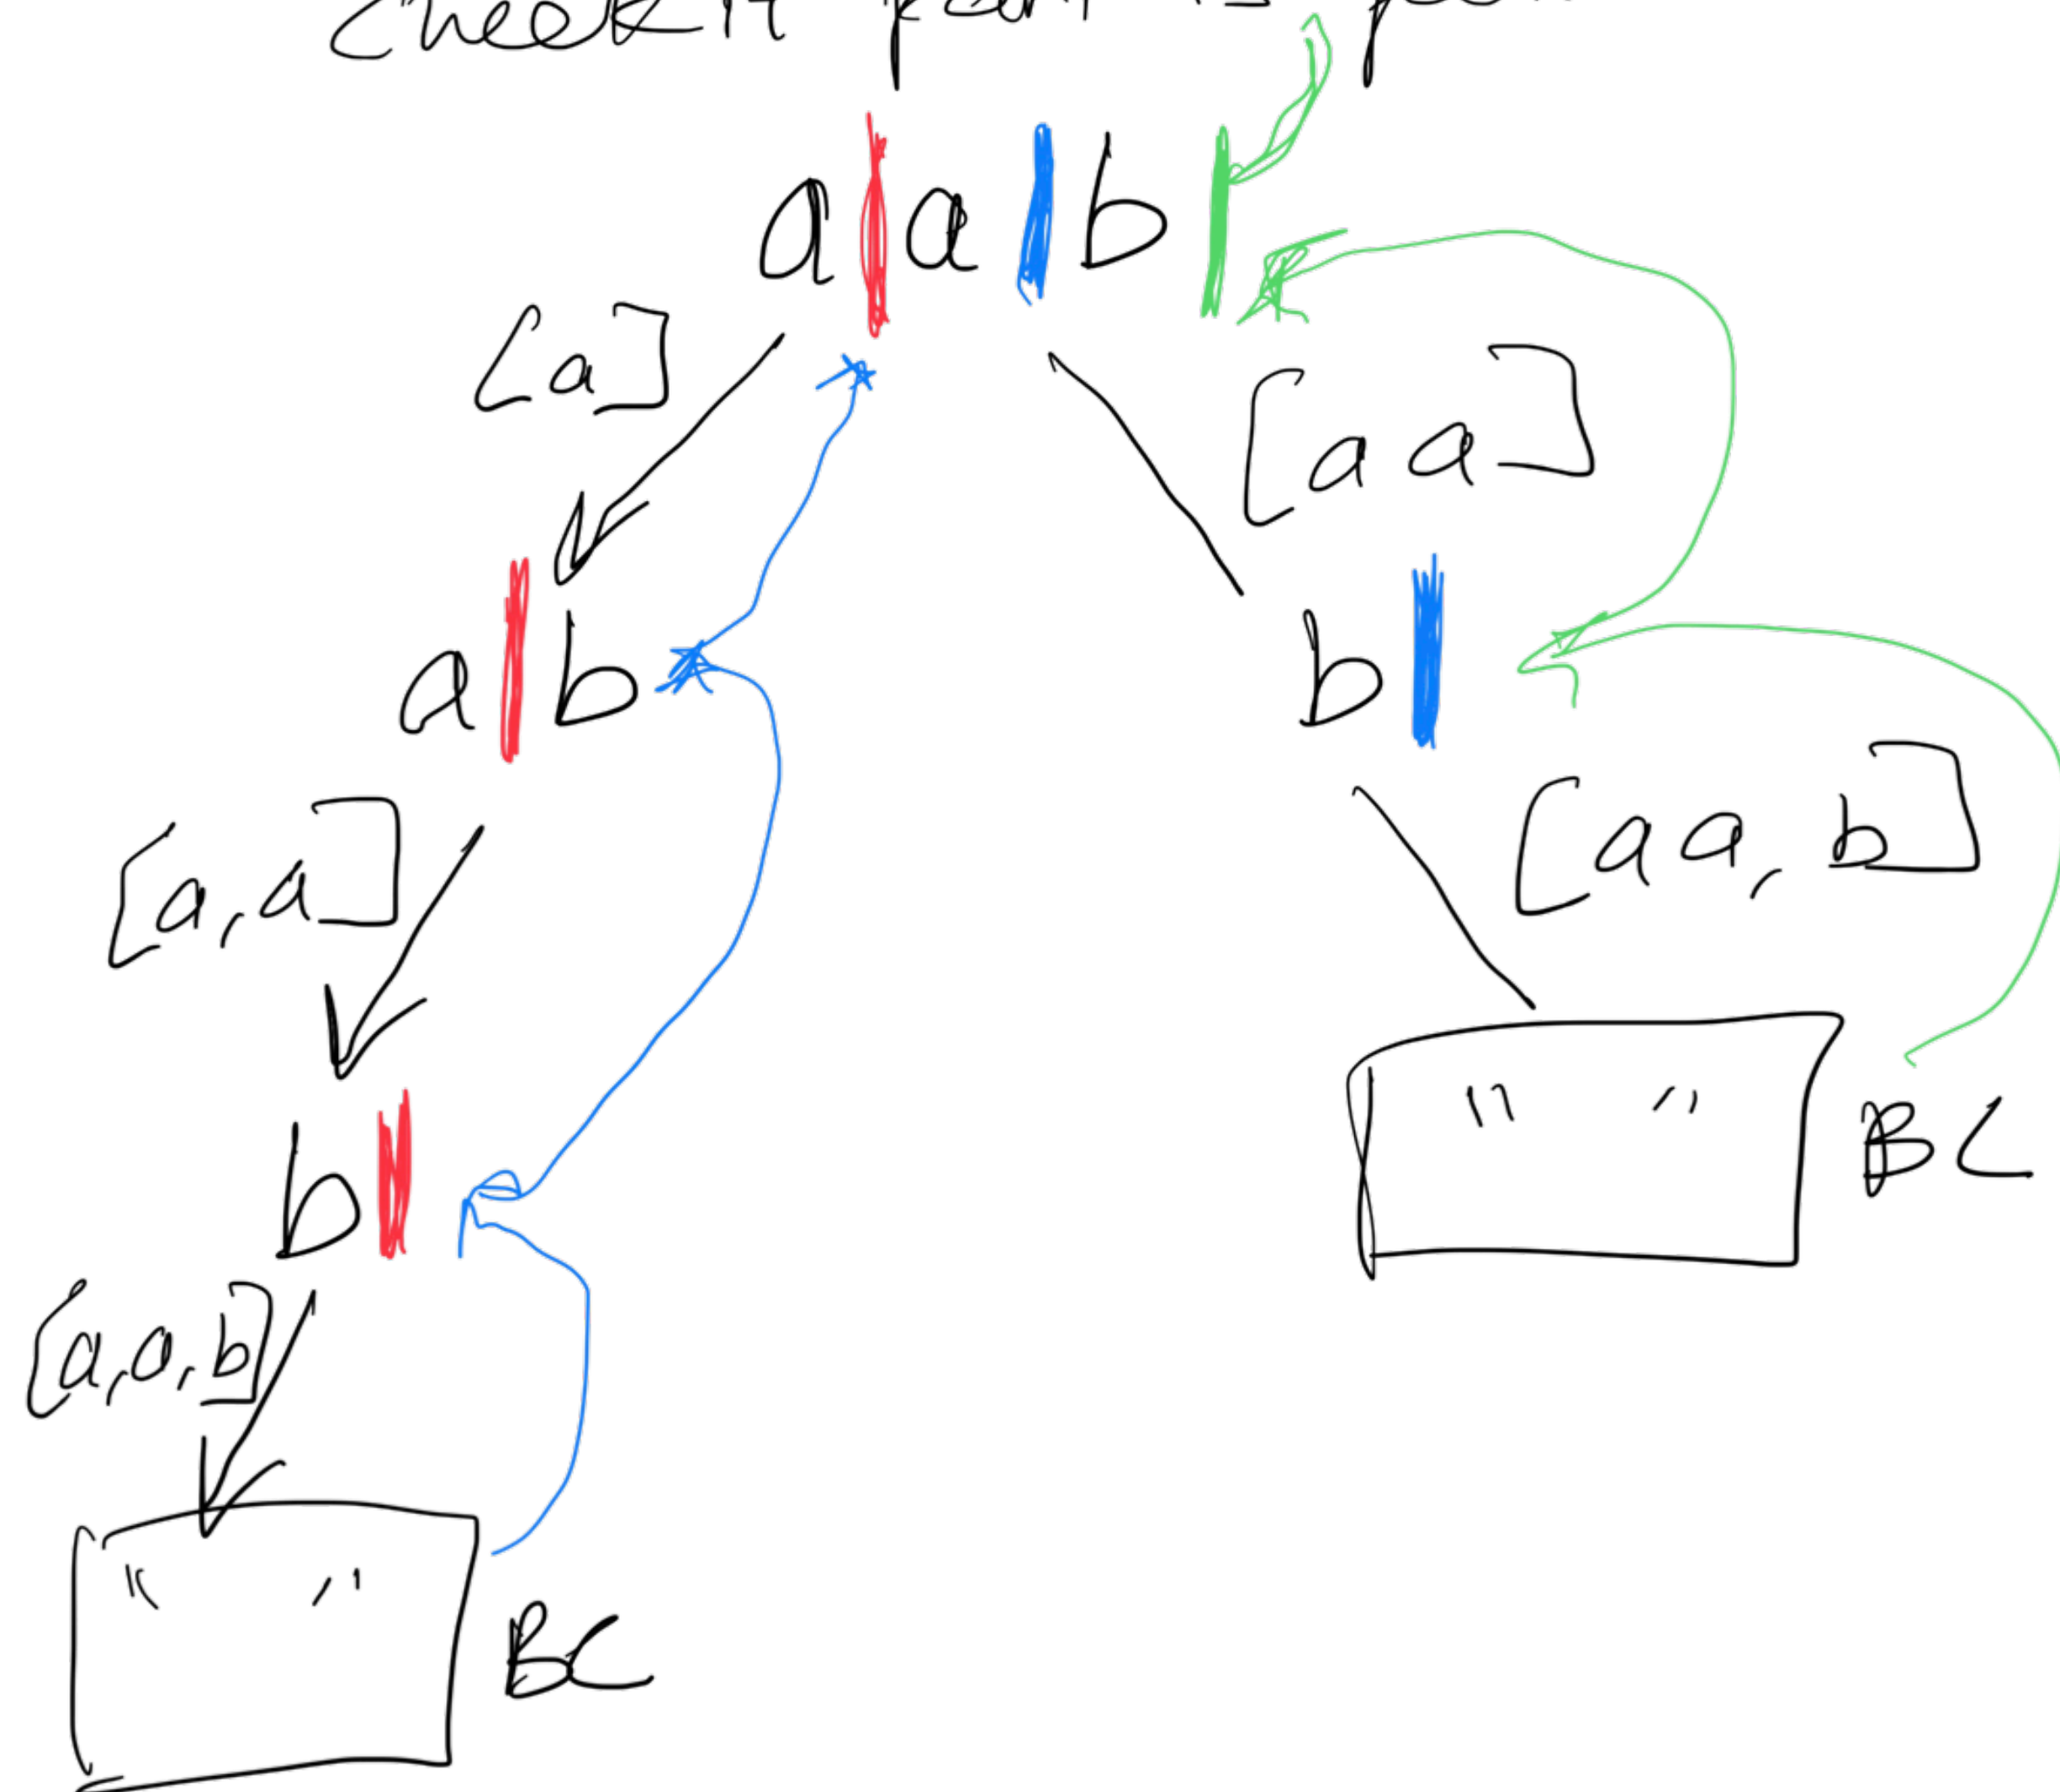

$\Rightarrow [aba, a, b, c]$

part = s.substring(0, i+1)

check if part is palindromic

Code

```
void getAllParts(s, partitions, ans) {
```

if (s.size() == 0) {

```
ans.pb(partitions)
return;
```

y

```

for (i = 0; i < n; i++) {
    // ...
}

```

```
string part = s.substr(0, i+1);
```

```

string part = ...
if (isPalin(part)) {

```

partitions. $pb(part)$:

```

partitions, for (i = 1; i < s.length; i++)
    gap(s.substring(i+1), partitions, ans);
}

```

```
partitions.popback(); //backtracking step
```
