

Subsets II

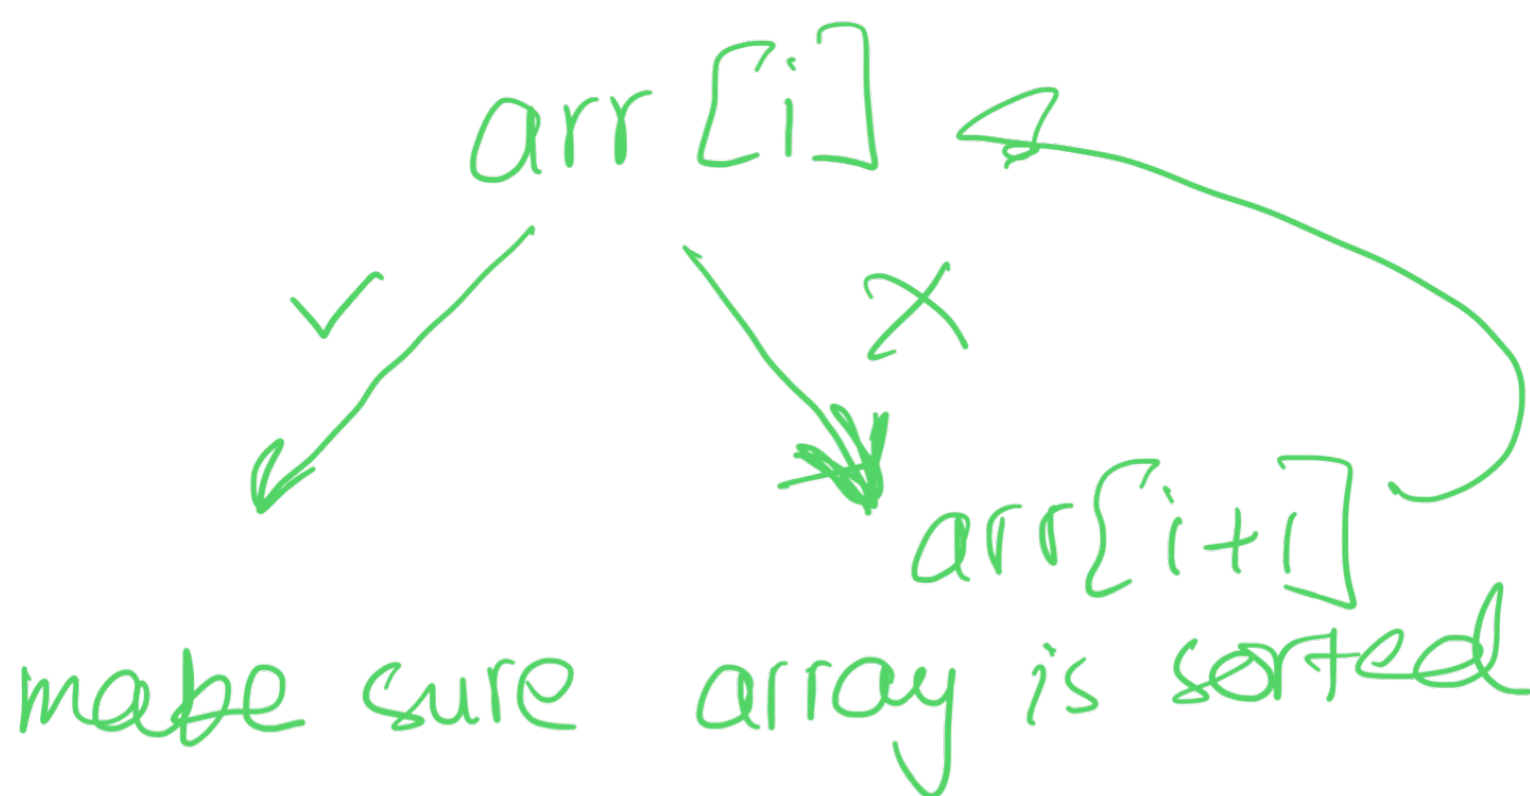

duplicate elements can exist

arr = [1, 2, 2]

Since we have duplicate
element we'll have
duplicate subsets

Once it we include $\Rightarrow$ exclude
next time when when we
exclude after backtracking
we mustn't include so we can
avoid duplicates

Code

```
void ps (arr[], ans[], i, allSubsets) {
    if (i == arr.size())
        allSubsets.push_back(ans)
        return
    ans.push_back(arr[i])
    ps(arr, ans, i+1)
    ans.pop_back()
    idn = i+1
    while (idn < n && A[idn] == A[idn-1])
        idn++
    ps(arr, ans, idn, allSubsets)
}
```
